Lecture 20

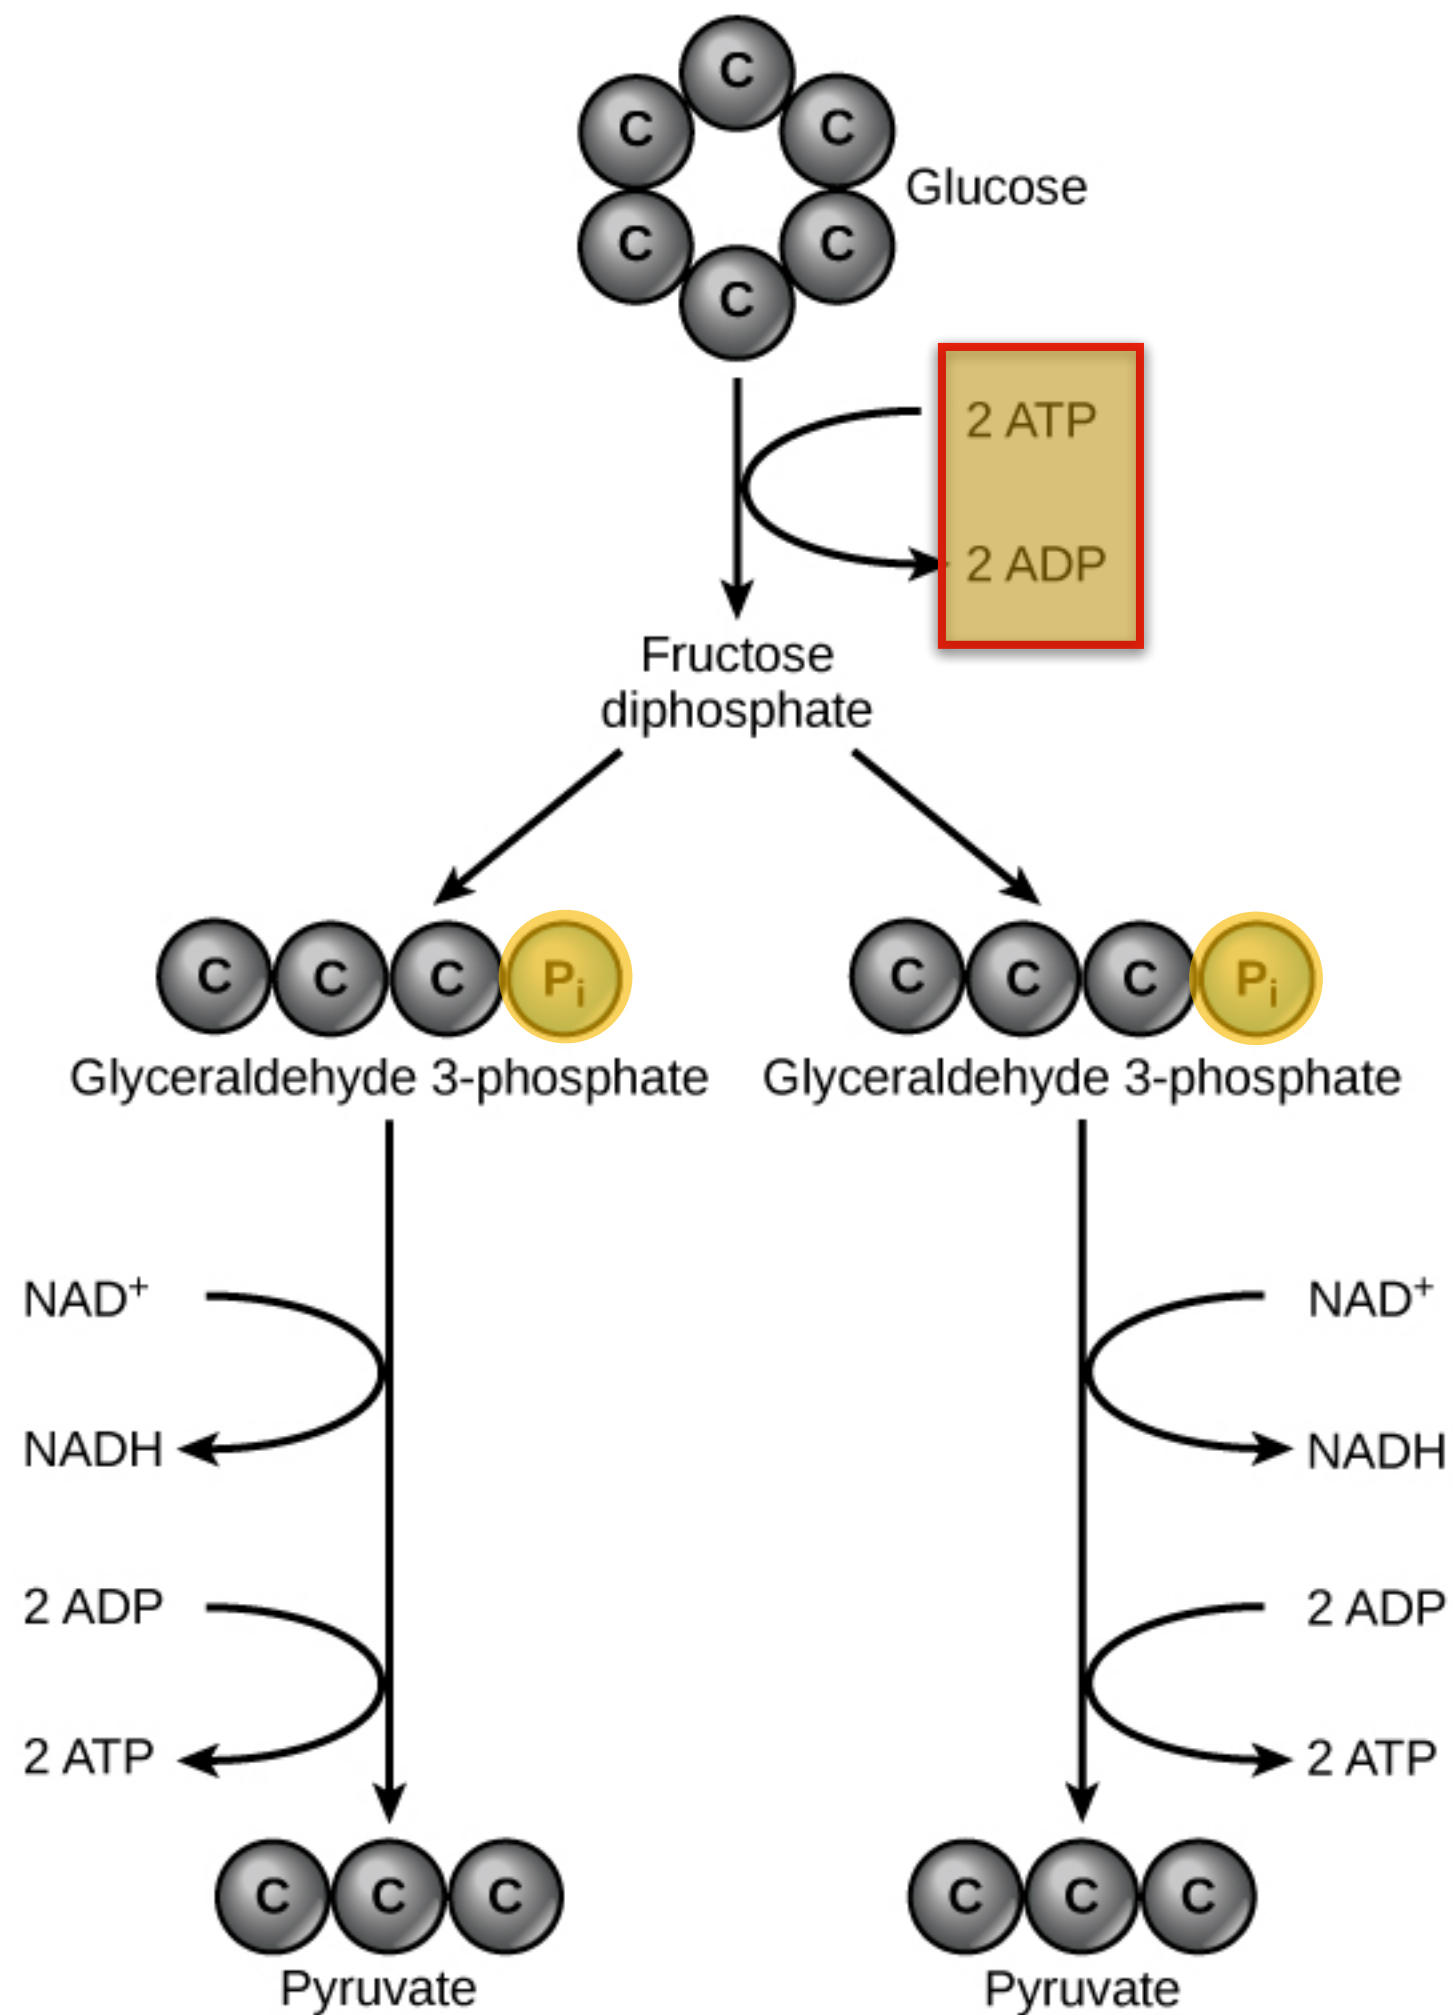

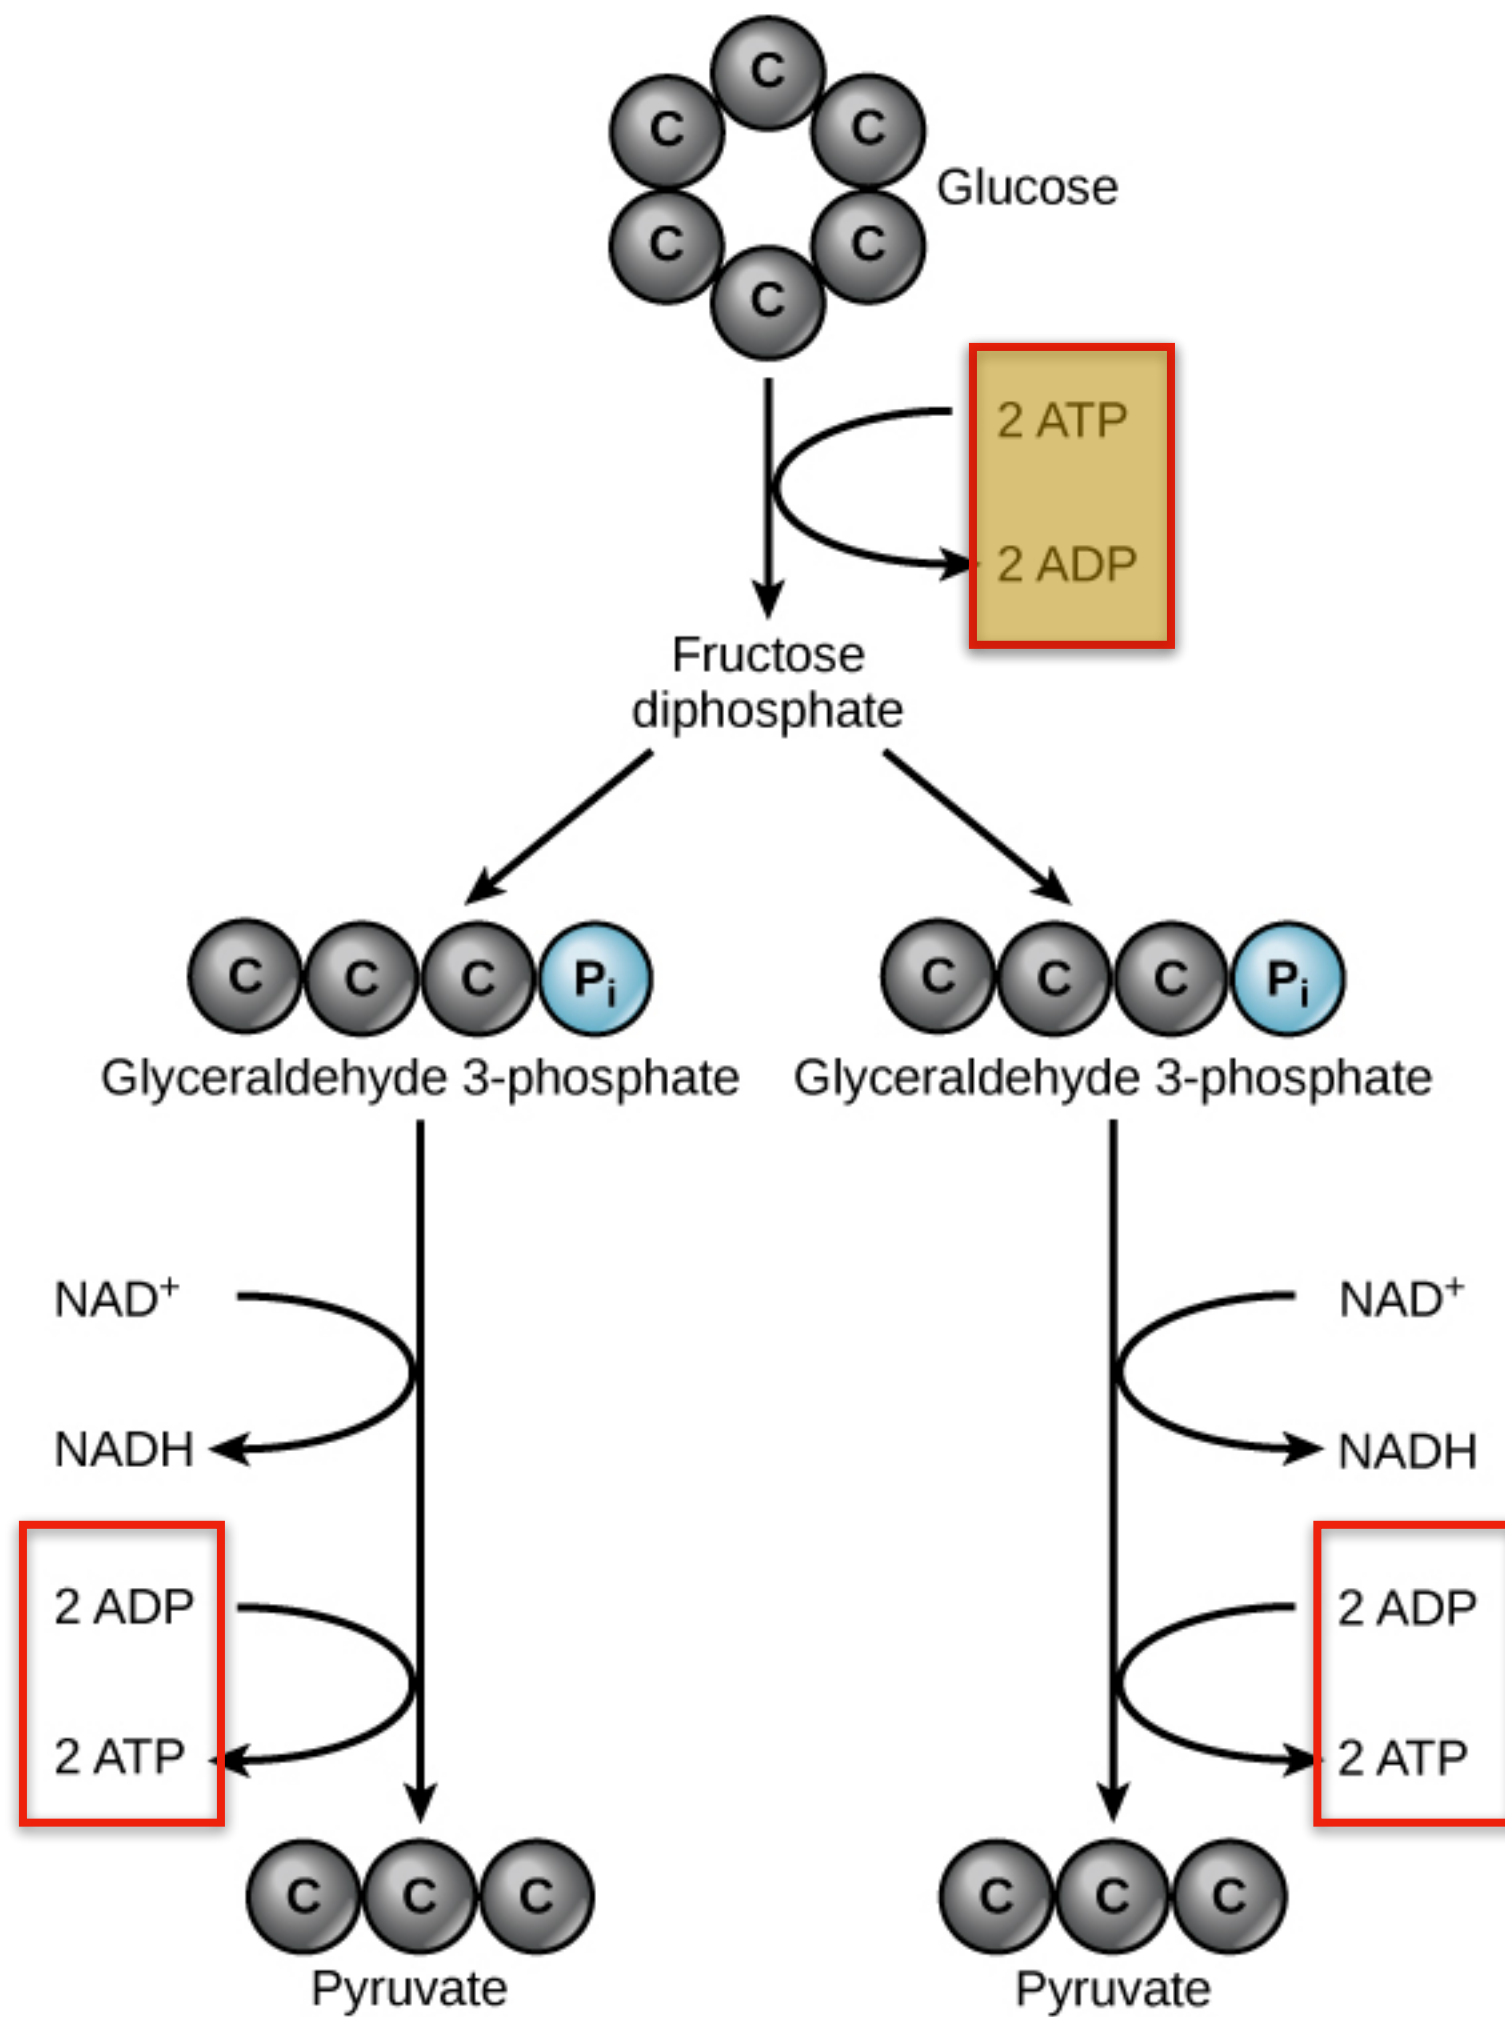

Glucose/Cell Metabolism -Respiration

AUTOTROPHS AND HETEROTROPHS

Aerobic

Glycolysis

Cellular respiration

Pyruvate oxidation

Citric acid cycle

Respiratory chain

- Complete oxidation
- Waste products: H_2O , CO_2
- Energy trapped: 36 **ATP**

Anaerobic

Glycolysis

Fermentation reaction(s)

- Incomplete oxidation
- Waste products: Organic compound
- Energy trapped: 2 **ATP**

AUTOTROPHS AND HETEROTROPHS

Aerobic

Glycolysis

Cellular respiration

Pyruvate oxidation

Citric acid cycle

Respiratory chain

- Complete oxidation
- Waste products: H_2O , CO_2
- Energy trapped: 36 **ATP**

Anaerobic

Glycolysis

Fermentation reaction(s)

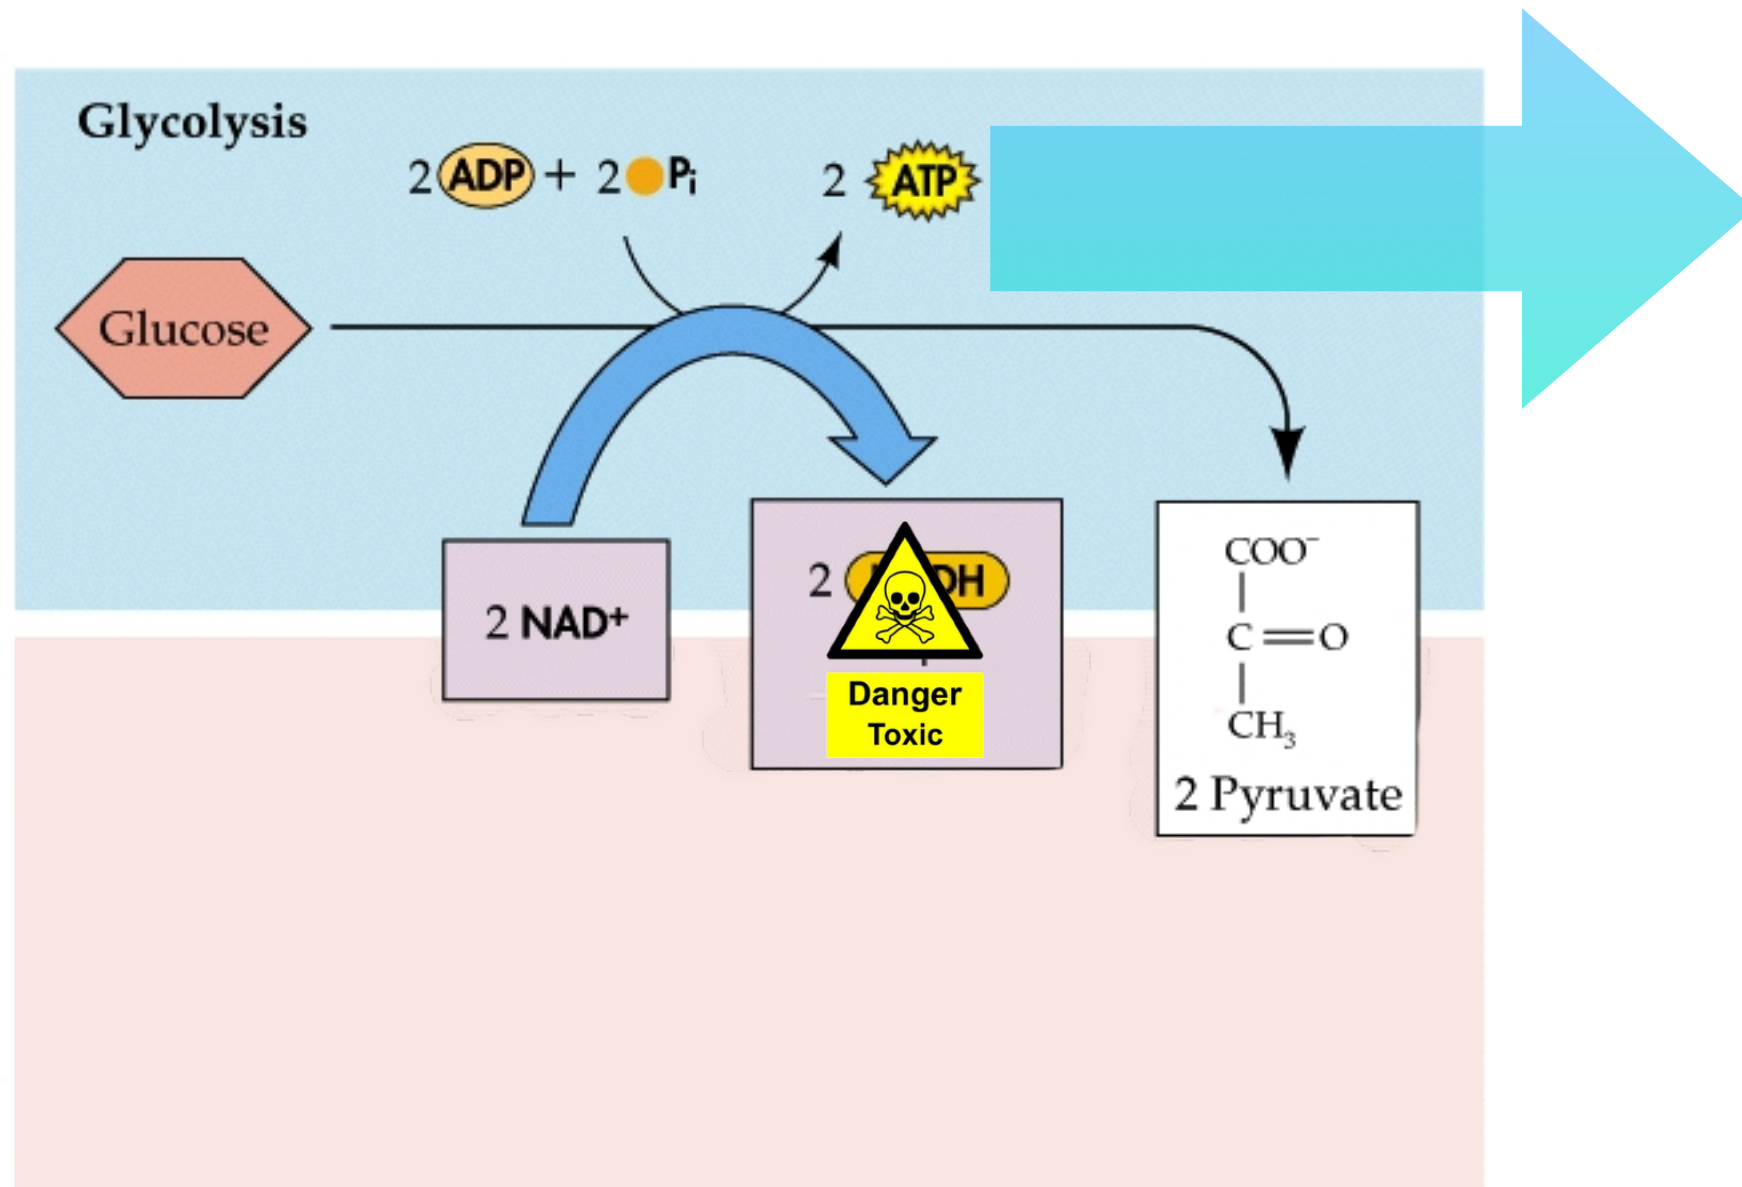

- Incomplete oxidation
- Waste products: Organic compound
- Energy trapped: 2 **ATP**

Anaerobic Conditions

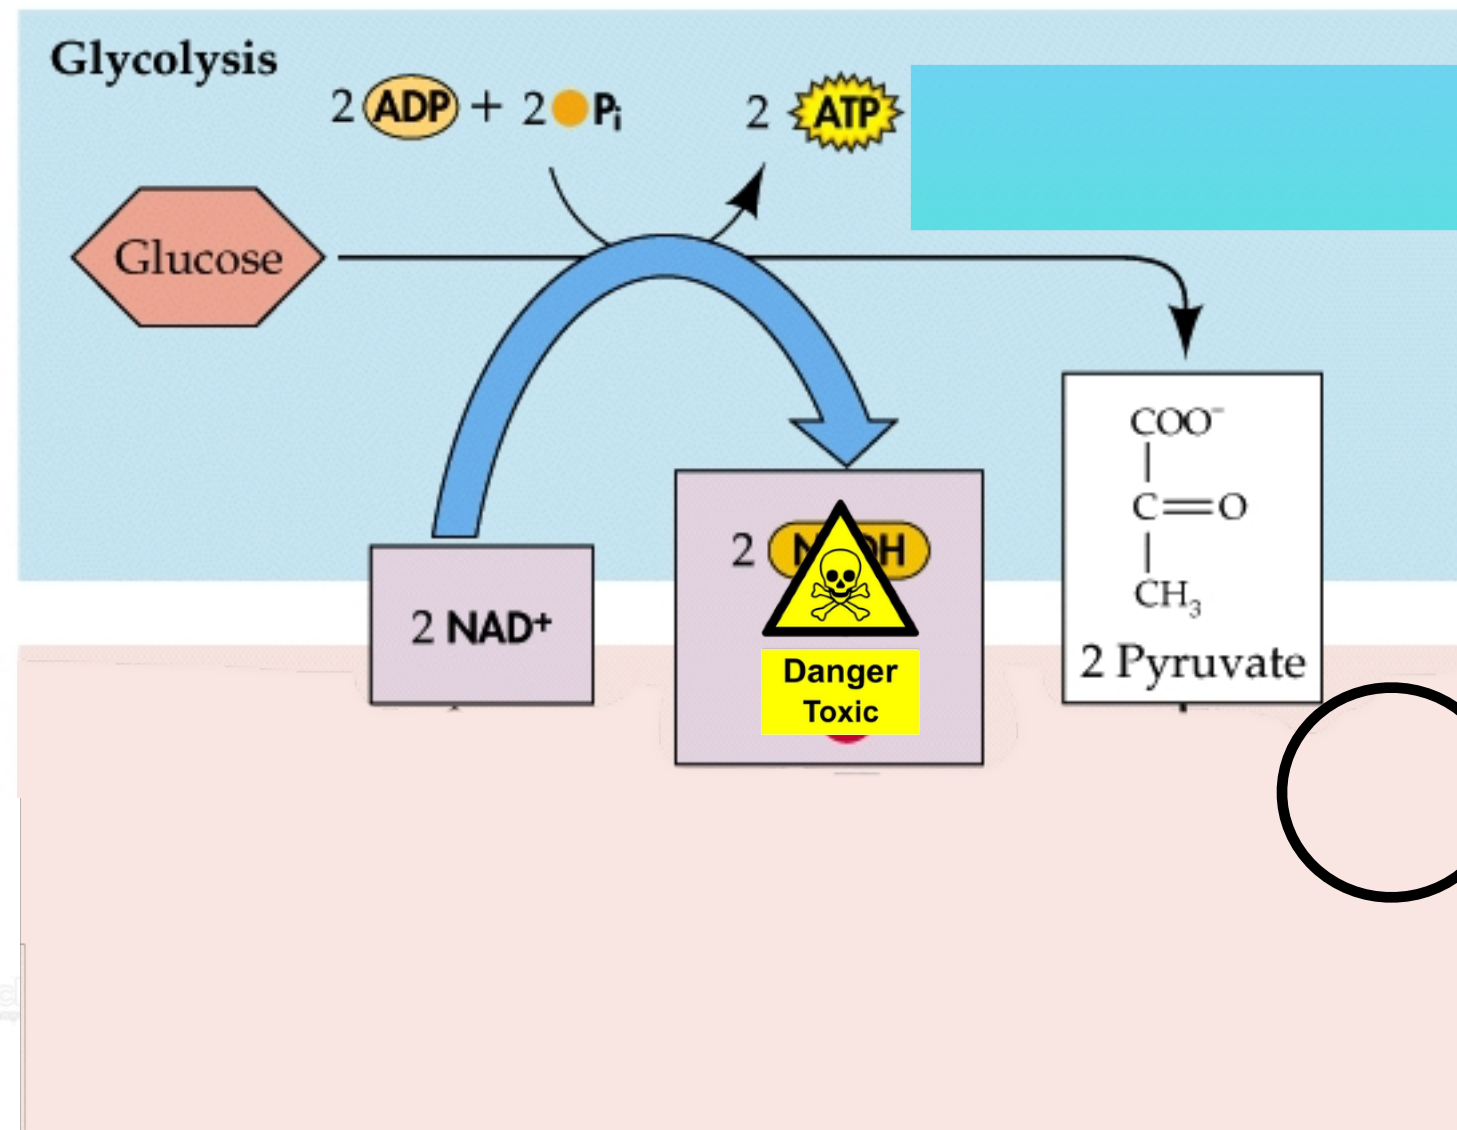

Fatigue

In the ABSENCE of oxygen the reduced form of **NAD⁺** (**NADH + H⁺**) builds up and becomes a cellular toxin...

It, therefore, needs to be **RECYCLED**...

Anaerobic Conditions

CHeers!~

Aerobic Conditions

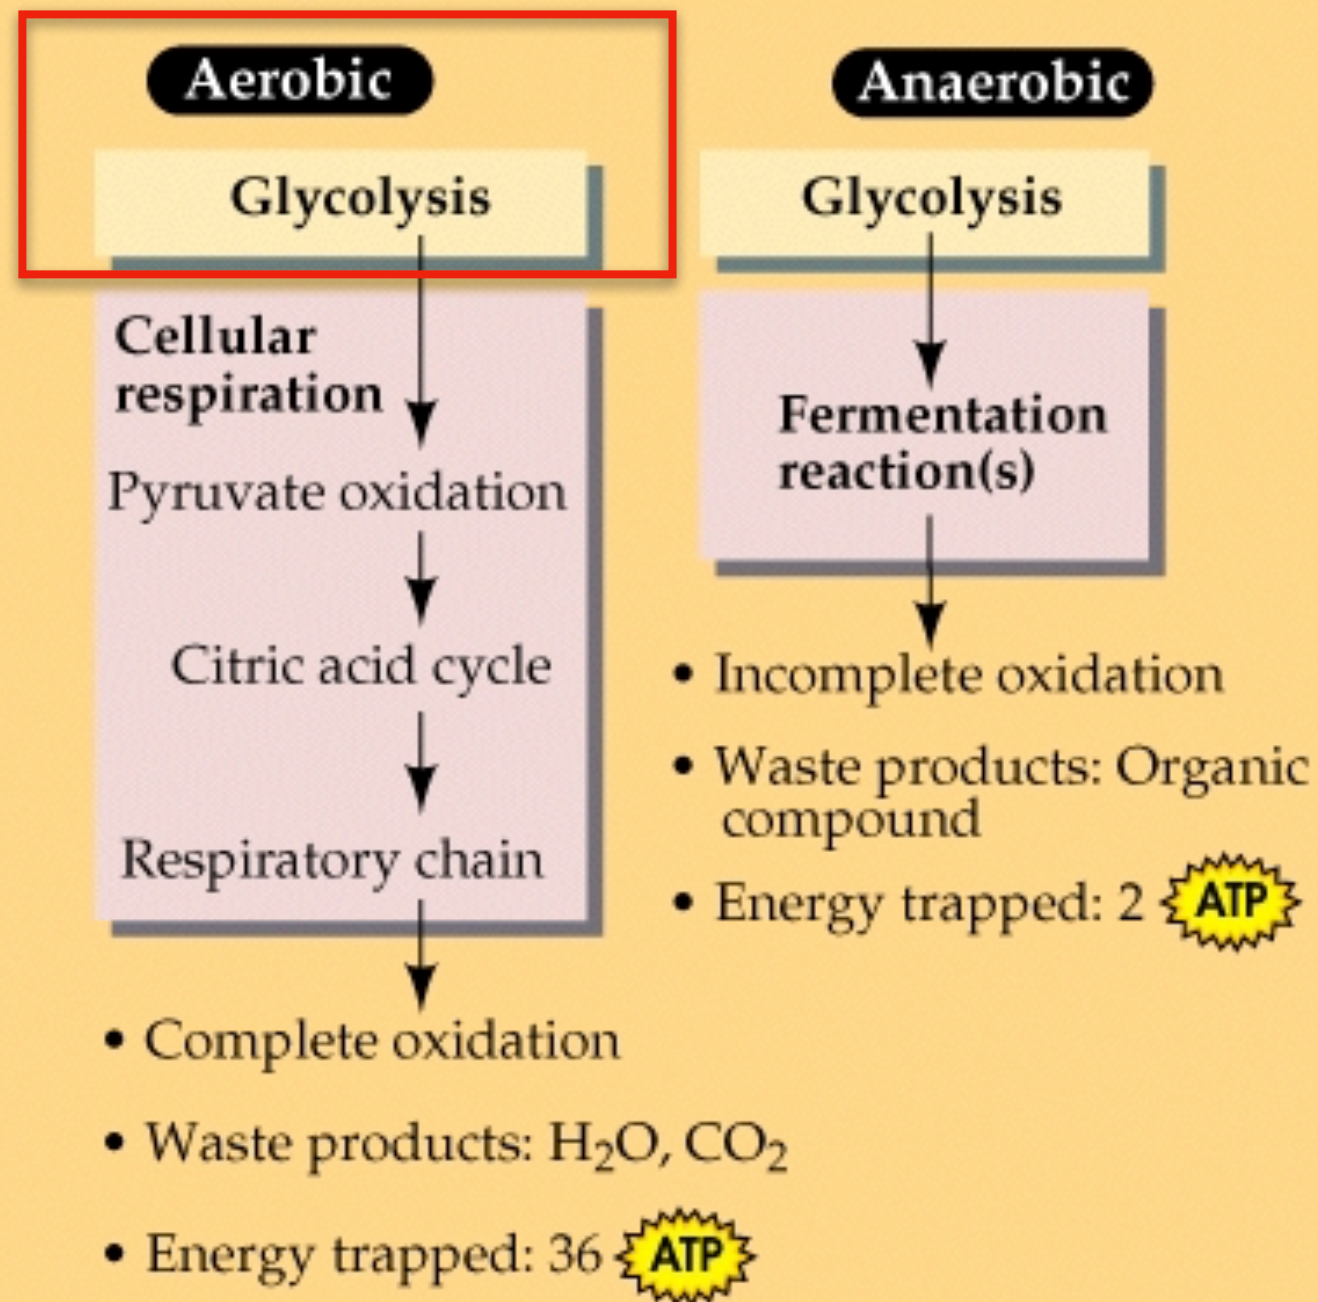

In the **presence of oxygen**, however, the reduced form of NAD⁺ (NADH + H⁺) can be converted back into the oxidized form...

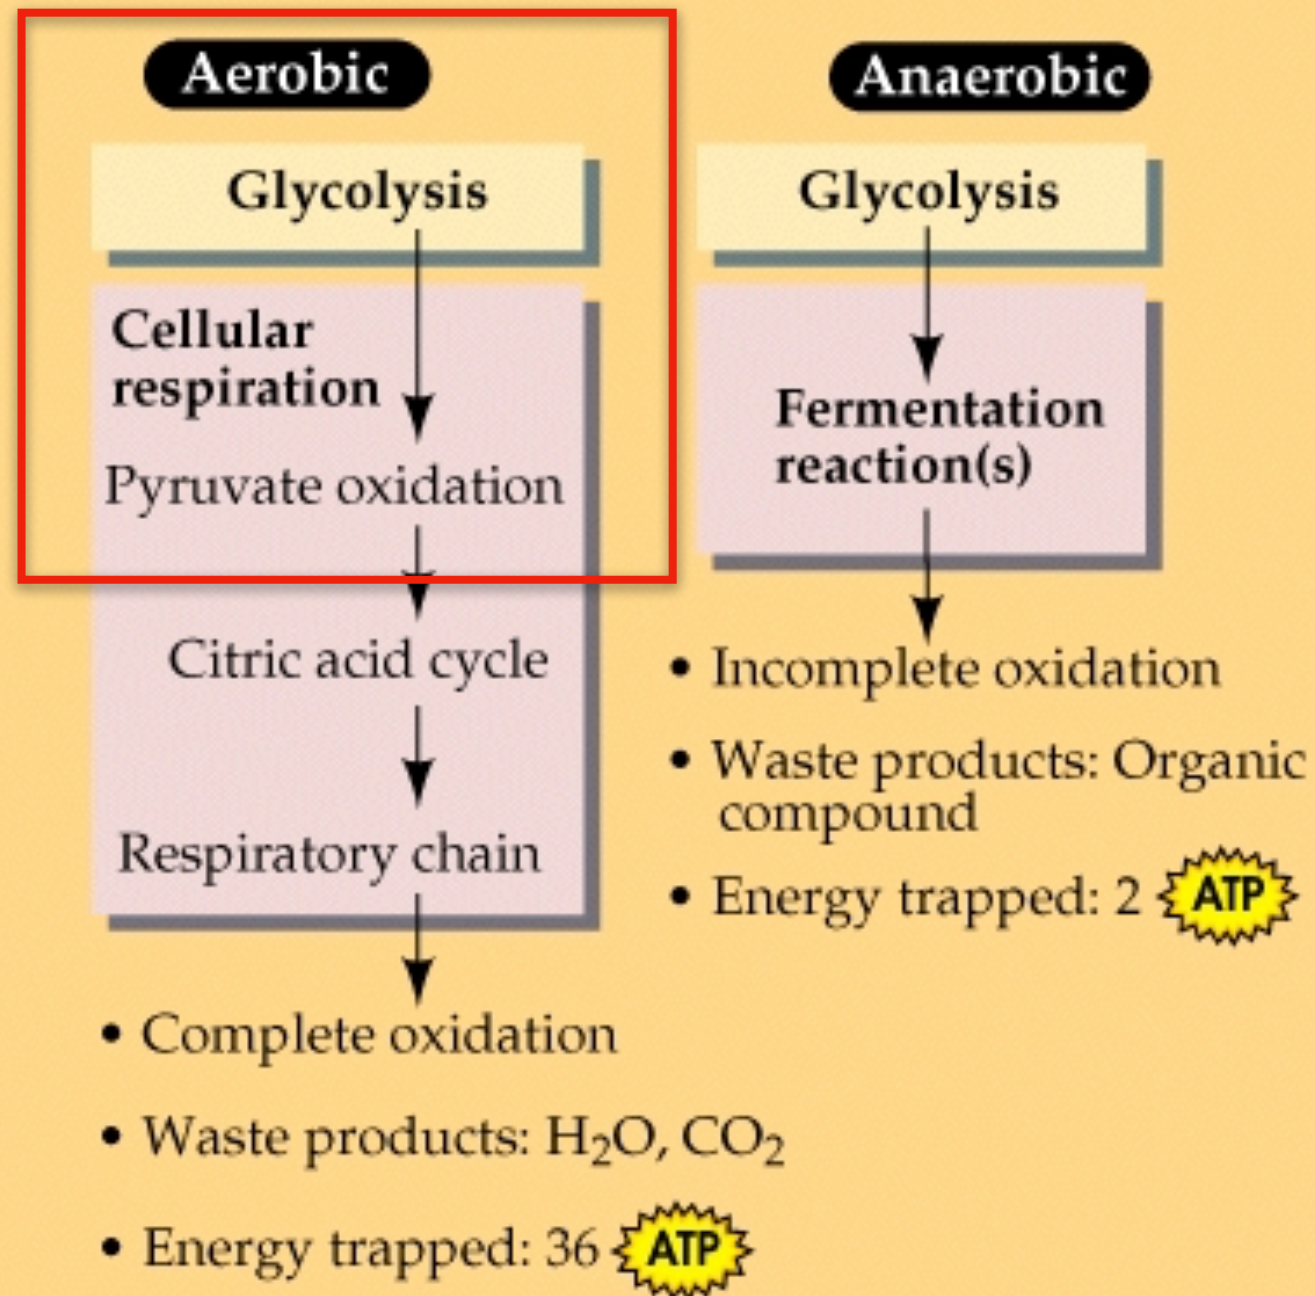

...and just like the normal reaction this is an **ENERGY yielding reaction**... with almost the same energy yield.

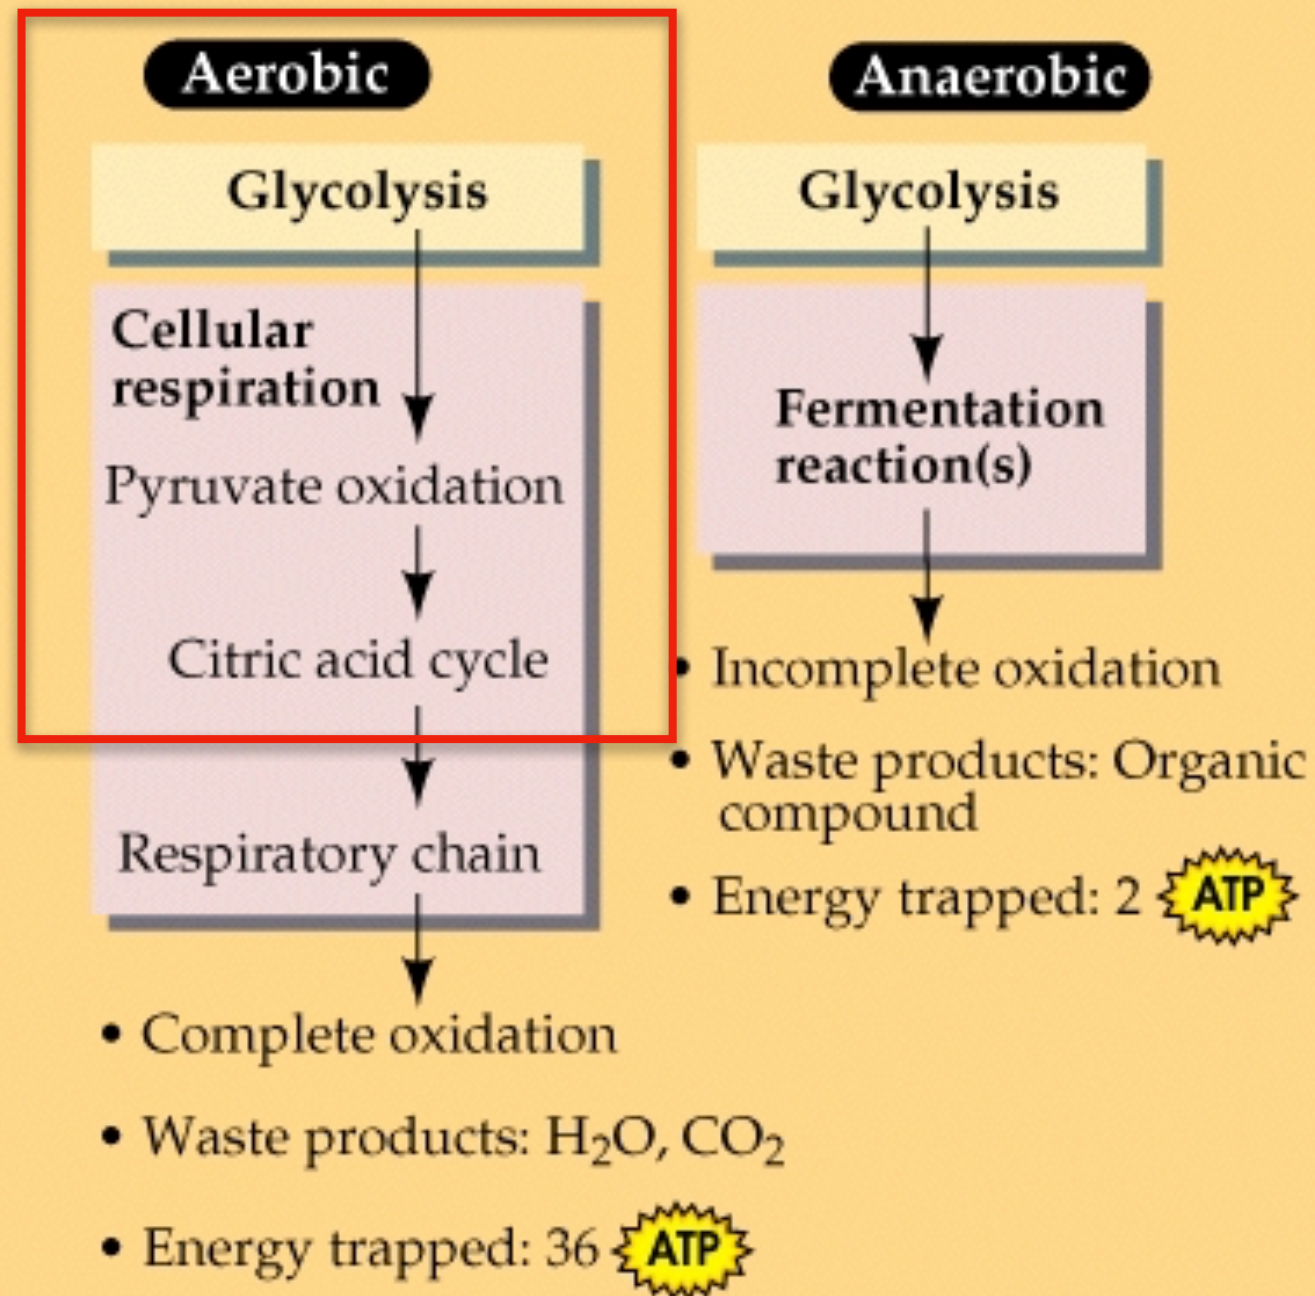

AUTOTROPHS AND HETEROTROPHS

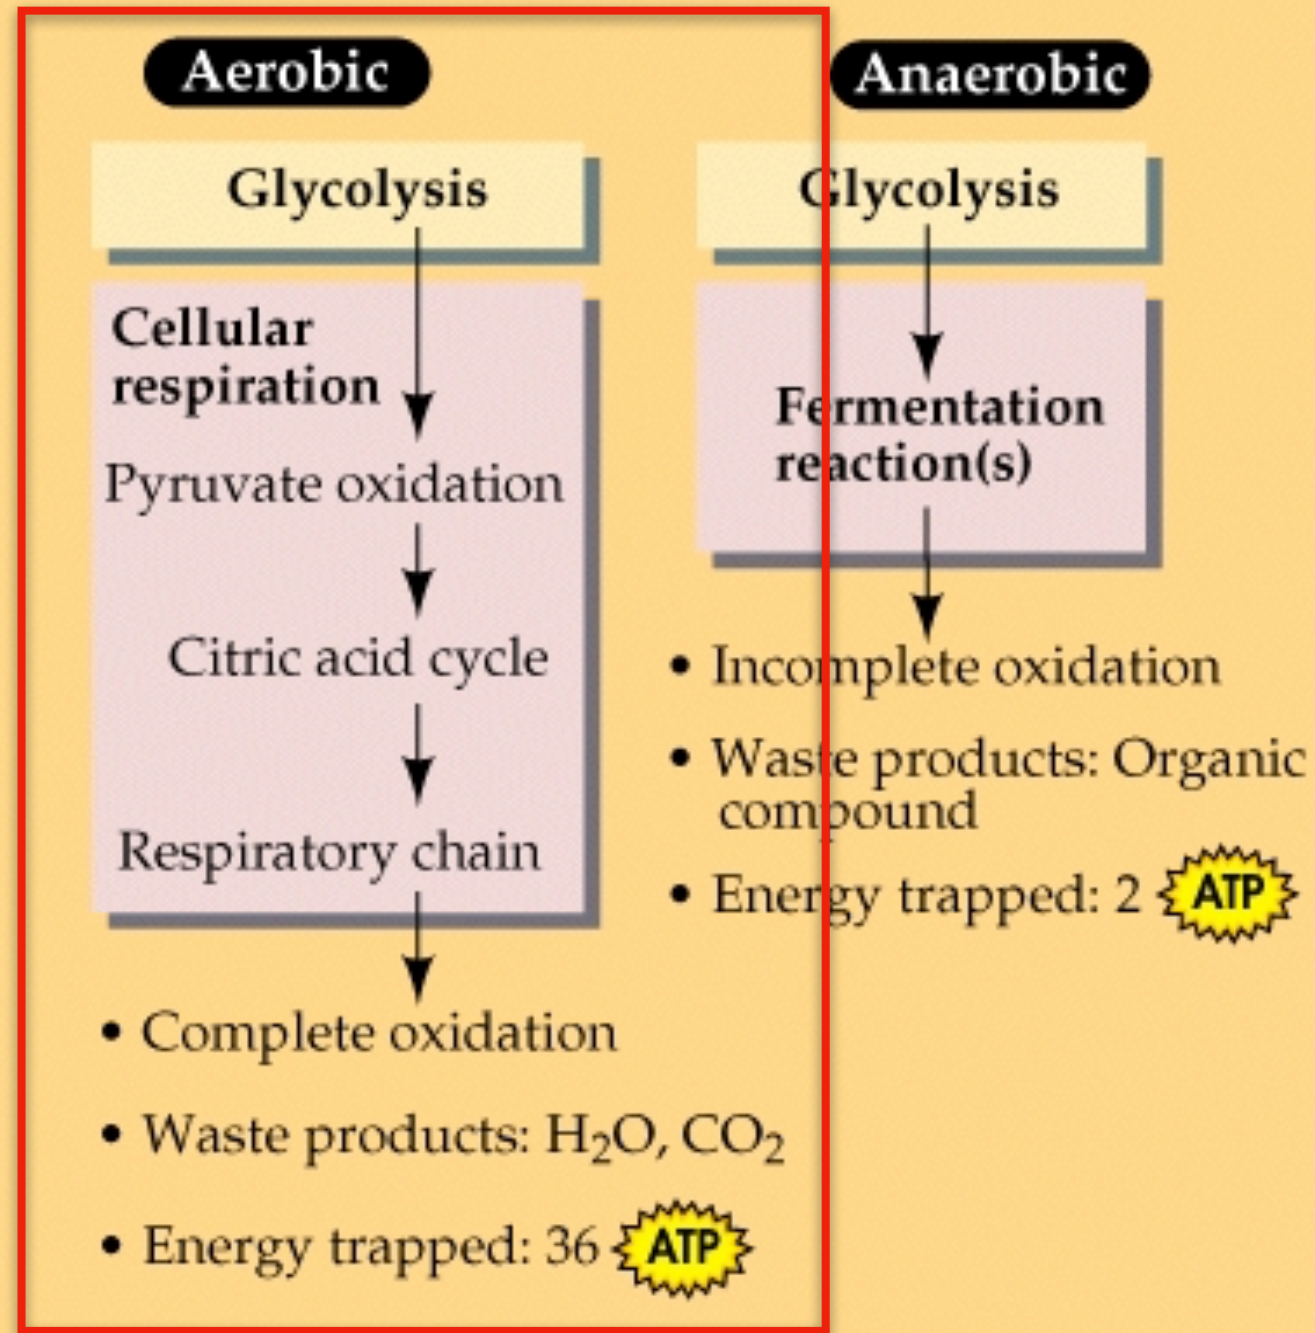

AUTOTROPHS AND HETEROTROPHS

AUTOTROPHS AND HETEROTROPHS

AUTOTROPHS AND HETEROTROPHS

GLUCOSE

more than 1/3
- 686 kcal/mol.

1 mole of Glucose \rightarrow - 686 kcal/mol

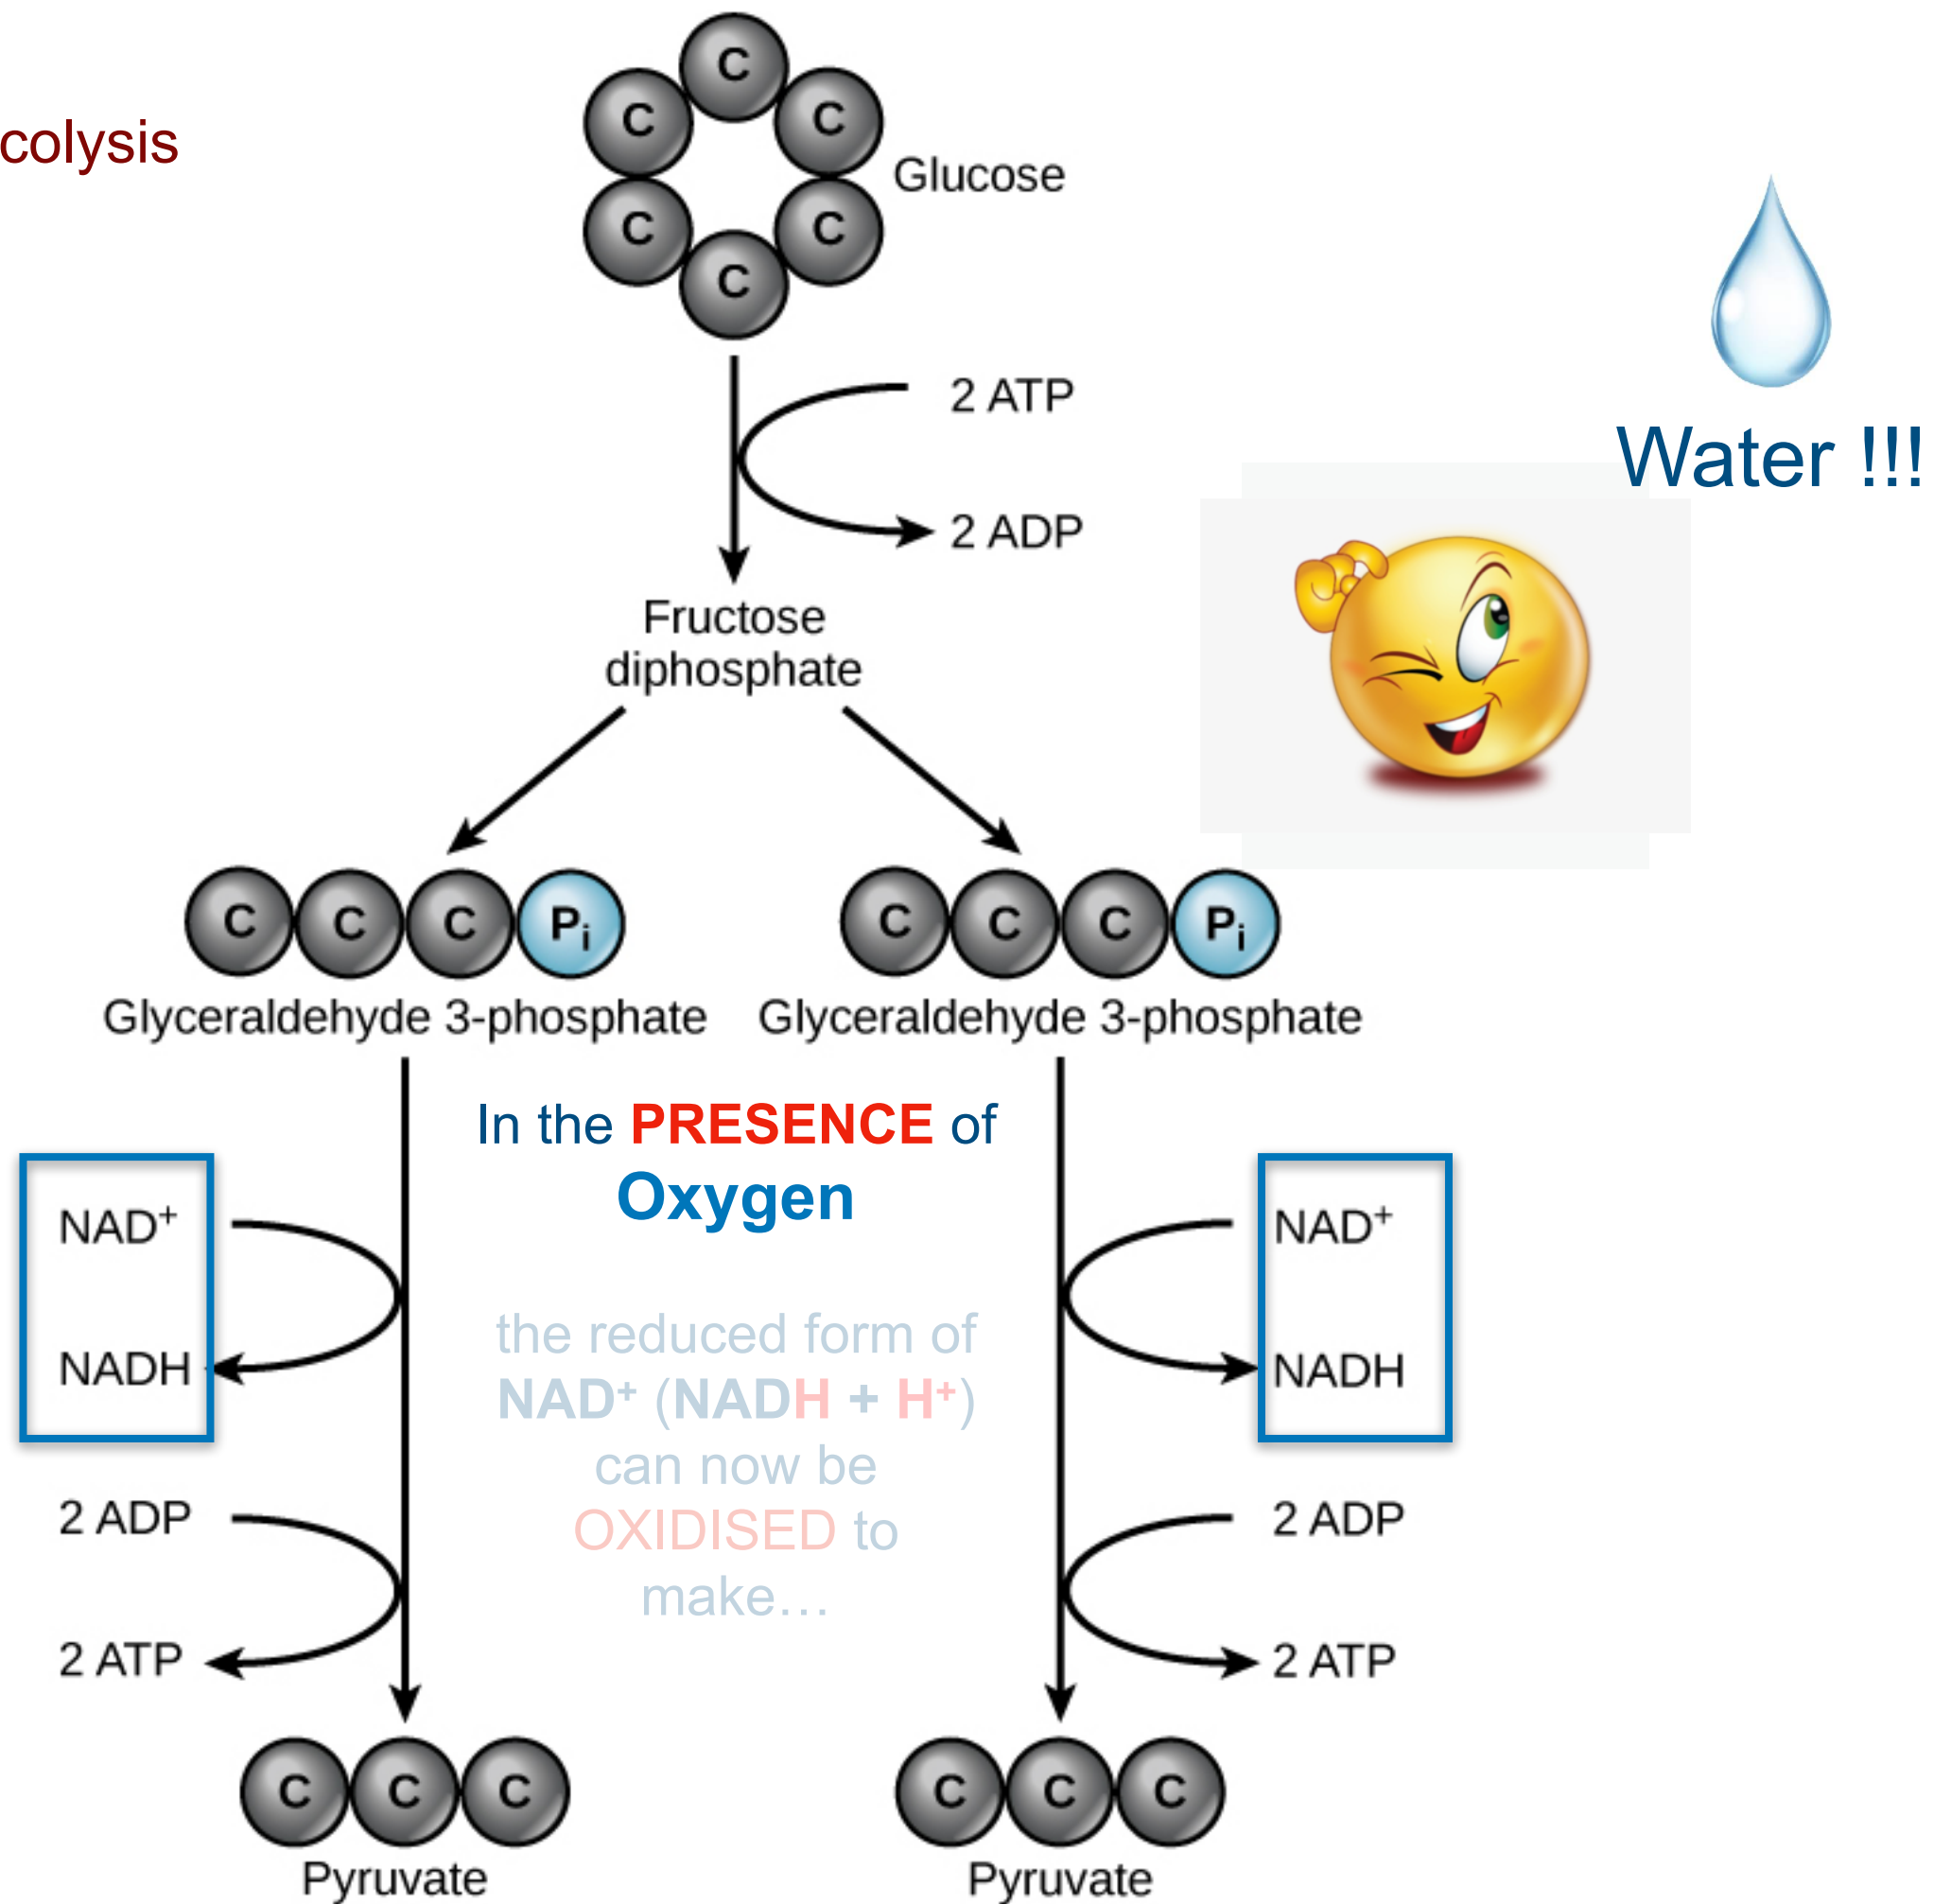

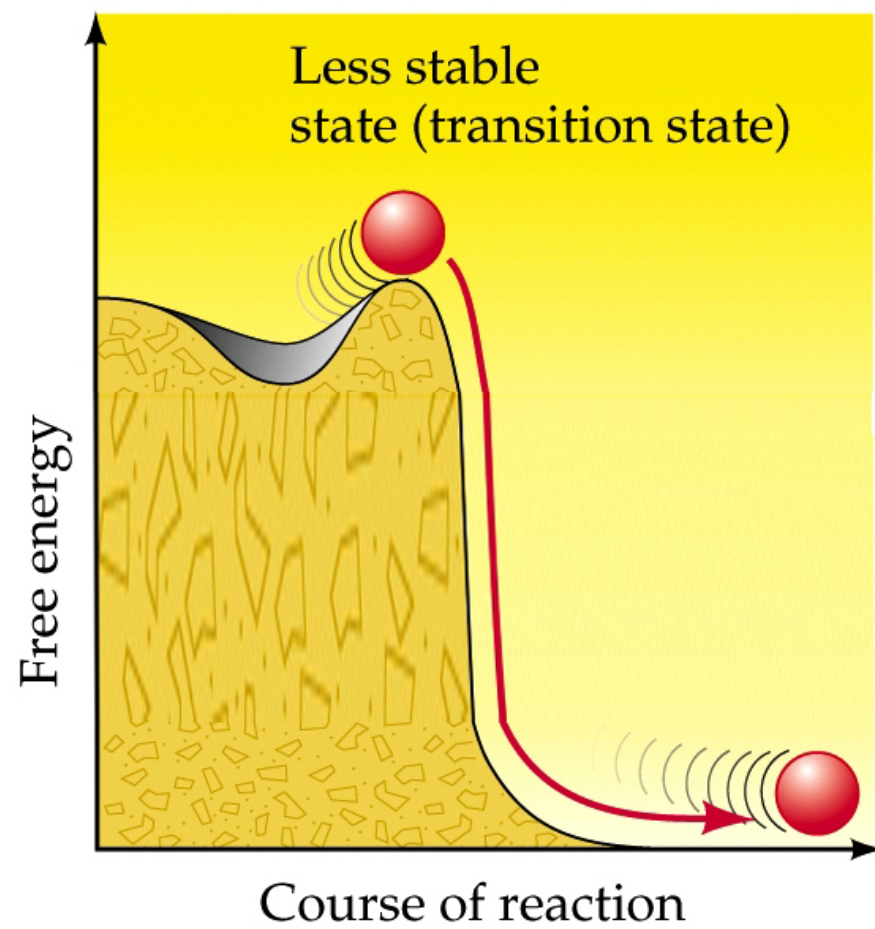

- 7.3 kcal/mol

1 mole of Glucose \rightarrow ~~~94~~ ATP's worth of energy

36 ...not too bad!!

STAGE 1: Glycolysis

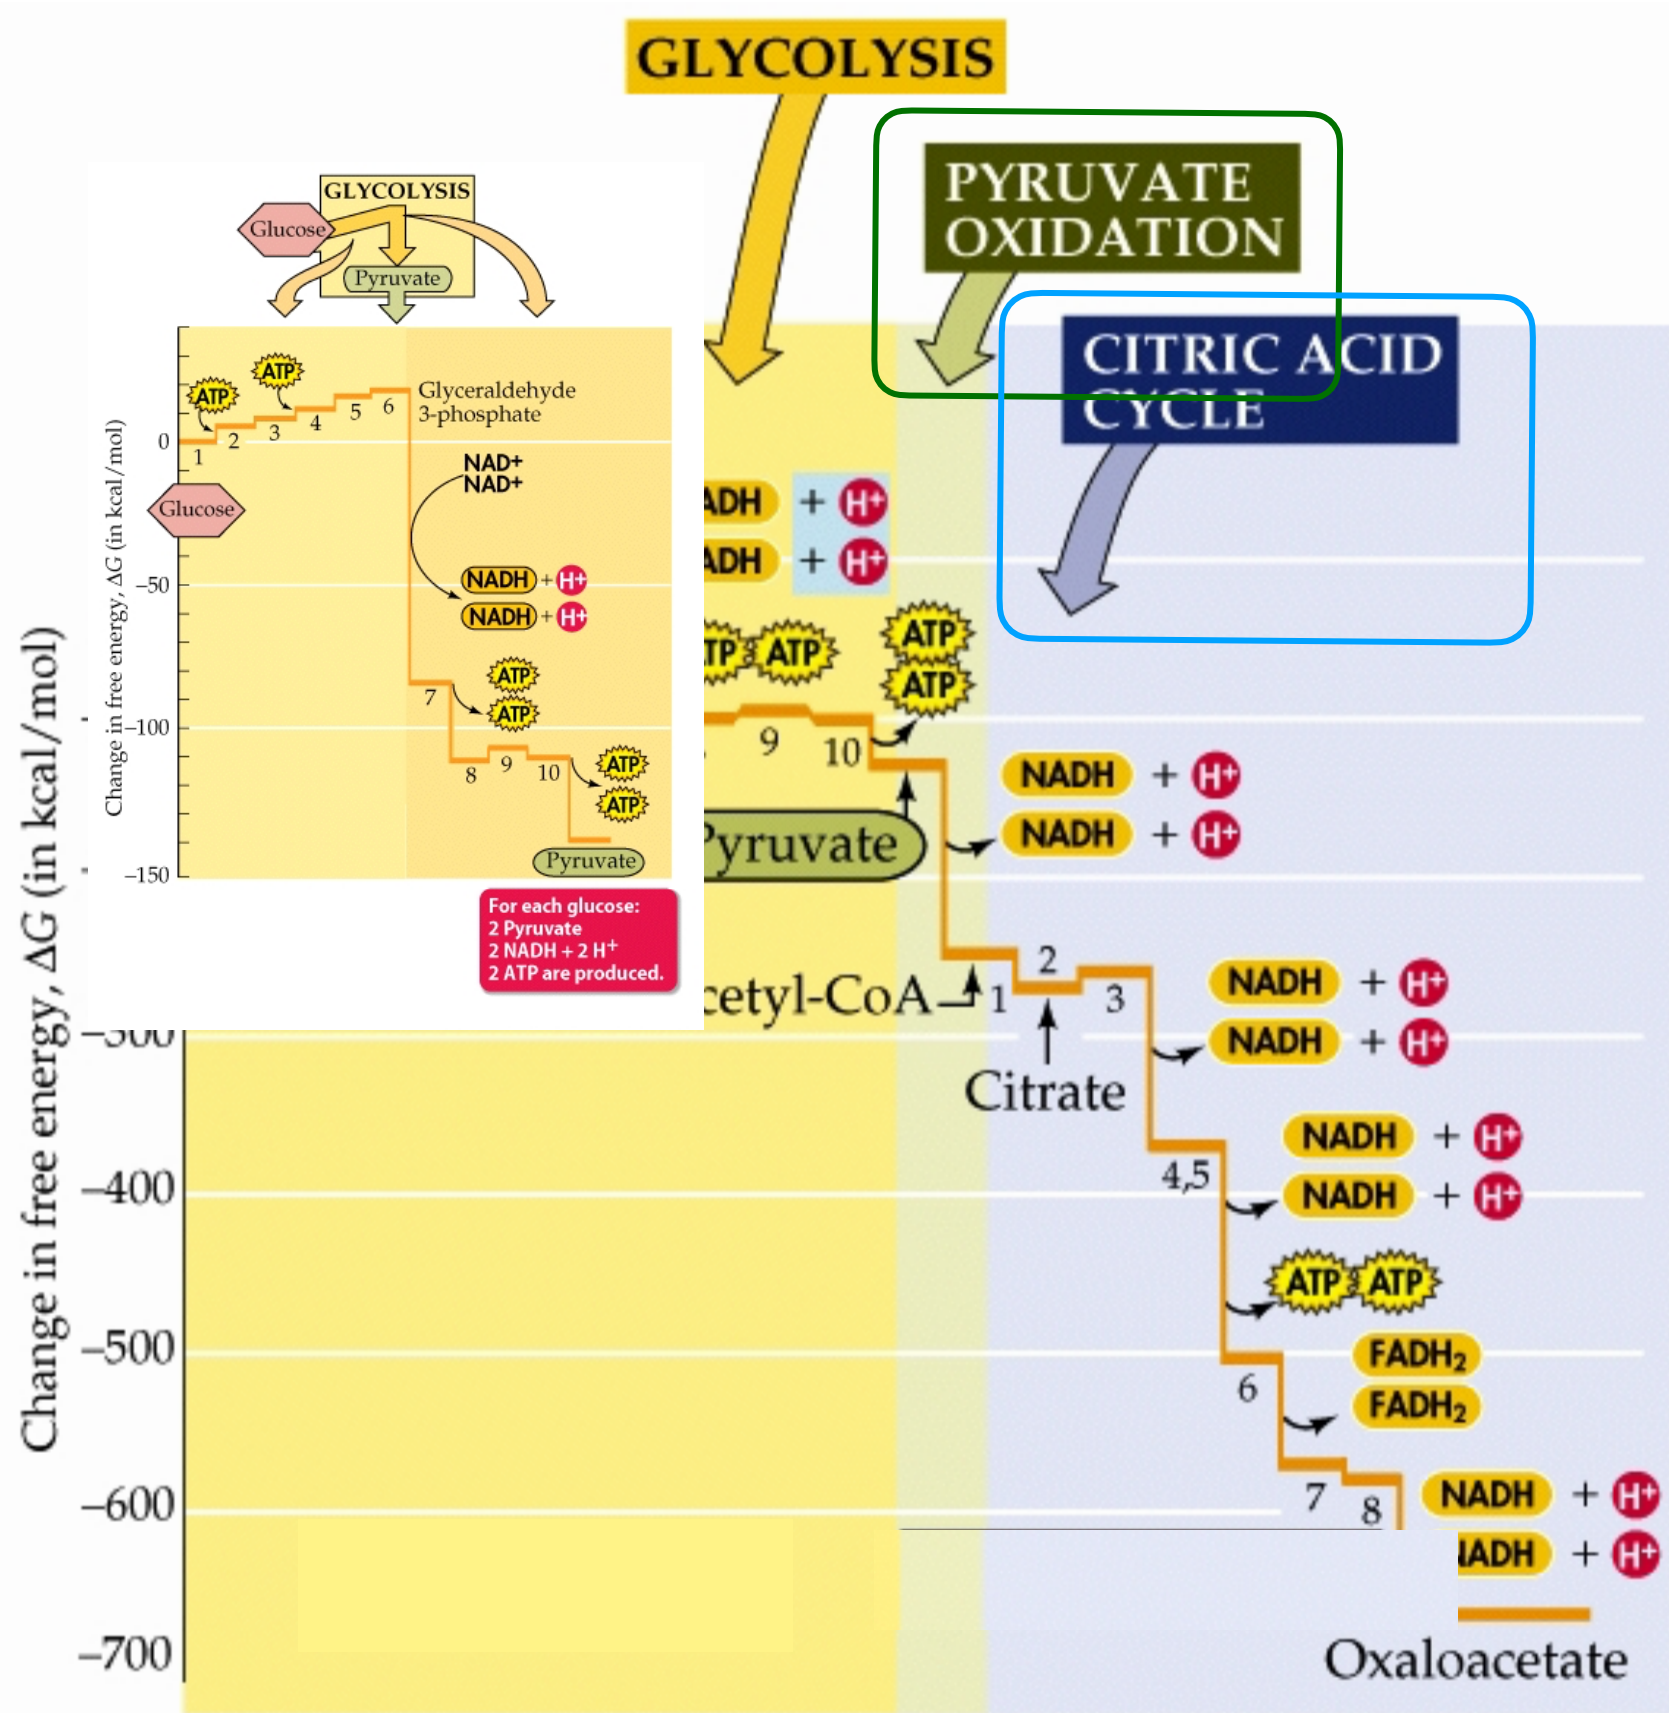

- 686 kcal/mol

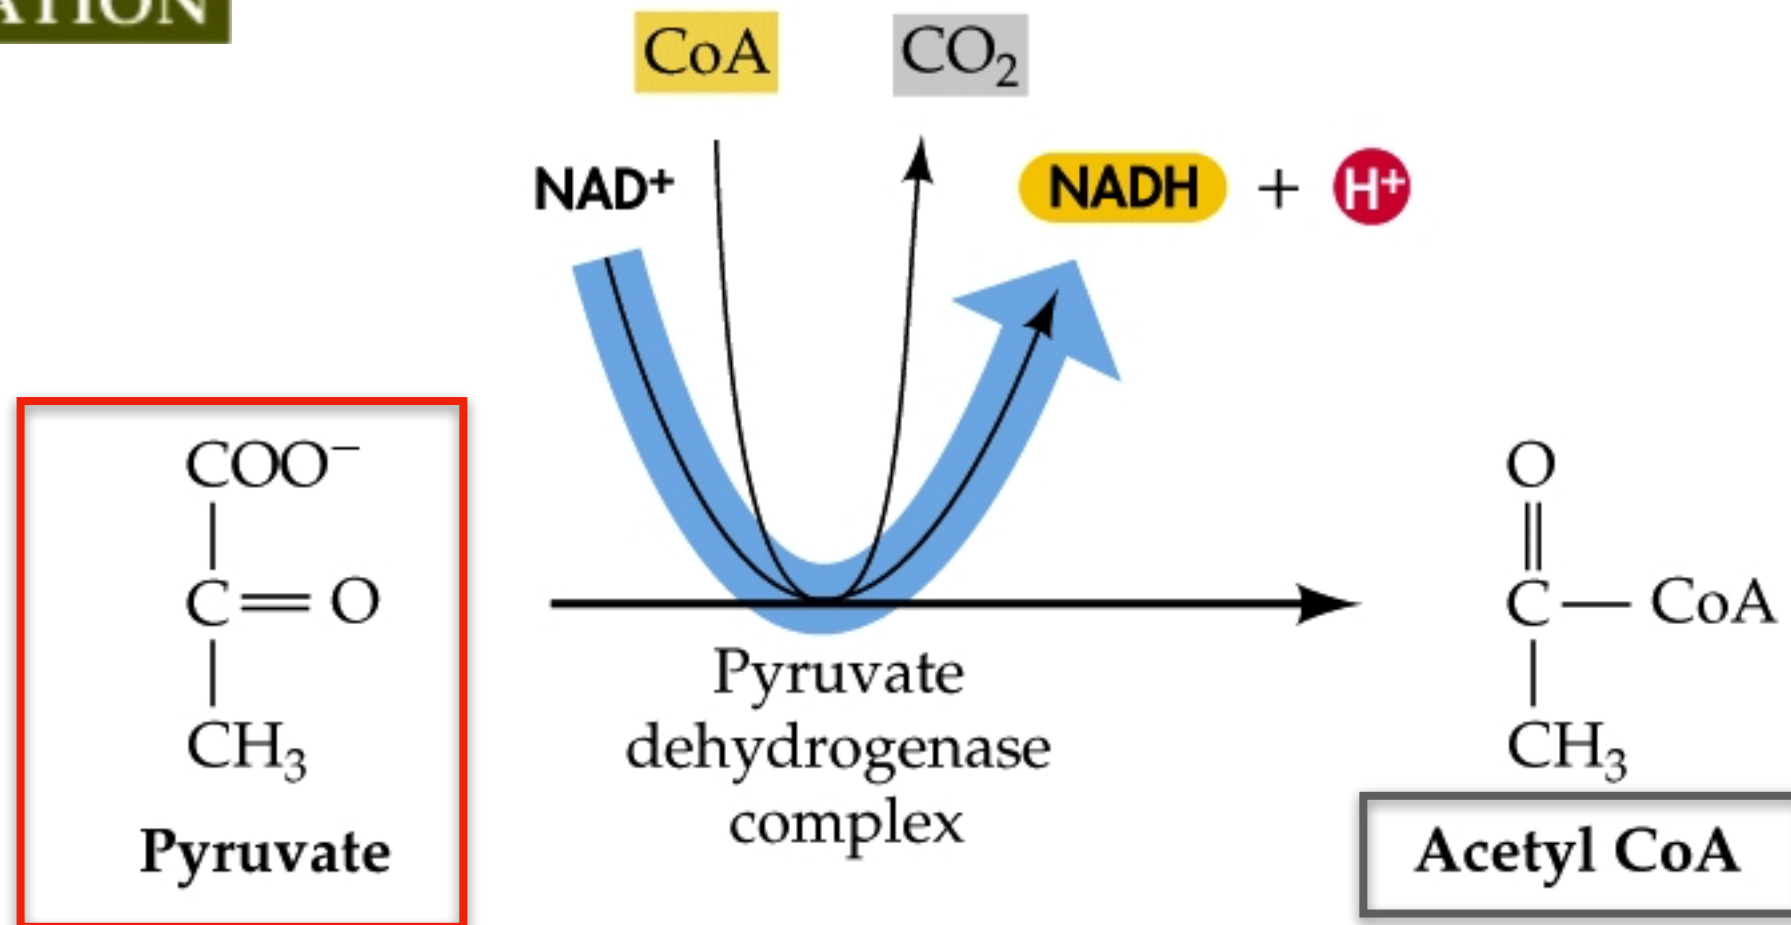

STAGE 2:

PYRUVATE OXIDATION

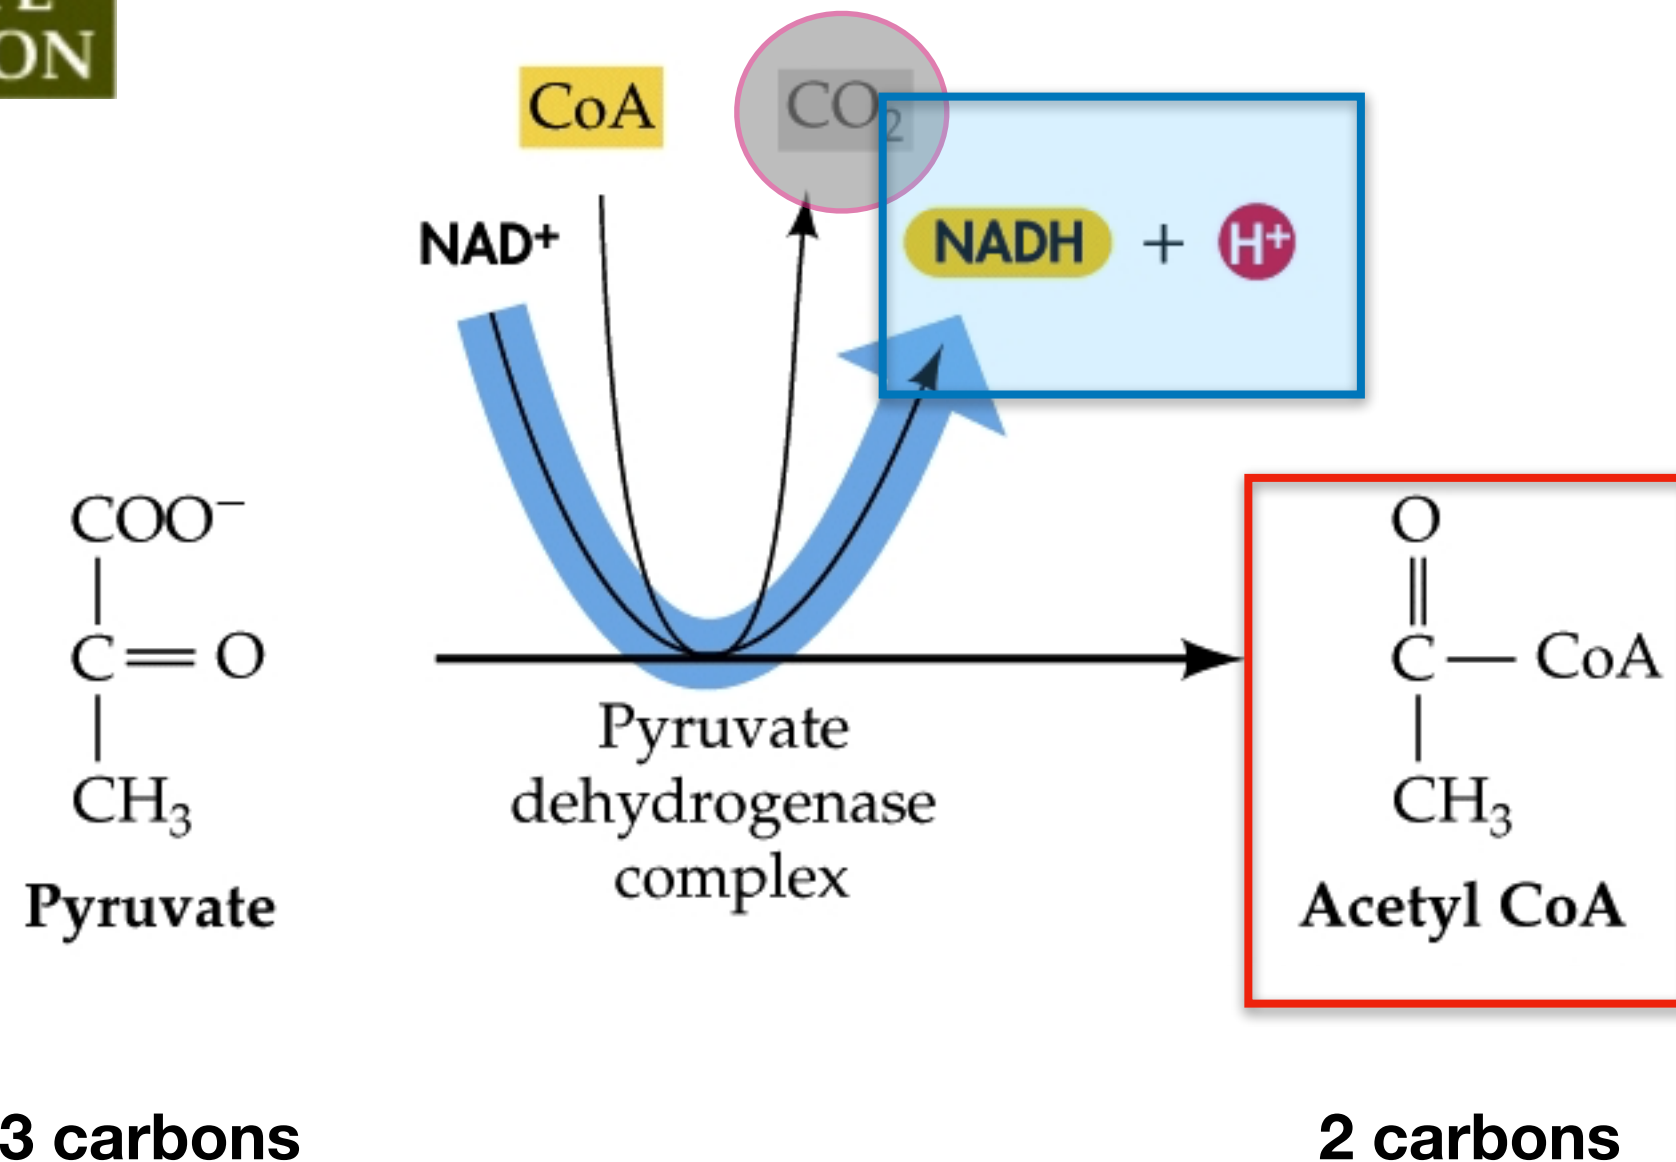

STAGE 2:

PYRUVATE OXIDATION

STAGE 2:

PYRUVATE OXIDATION

Glucose

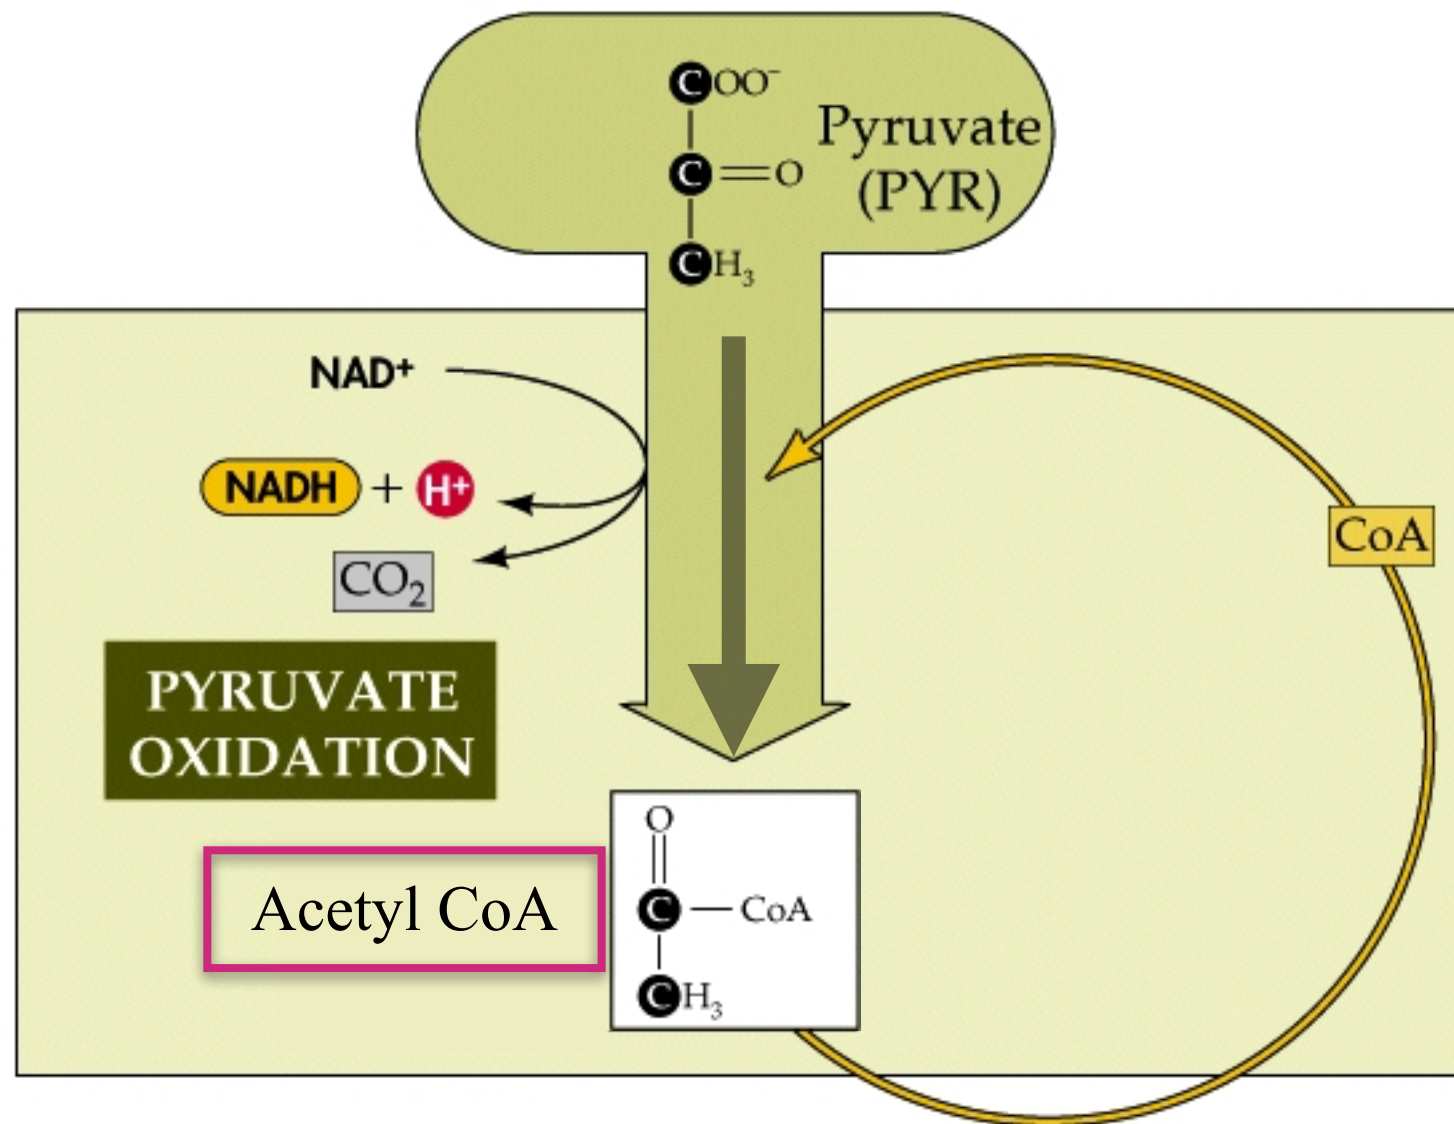

2 x Pyruvate

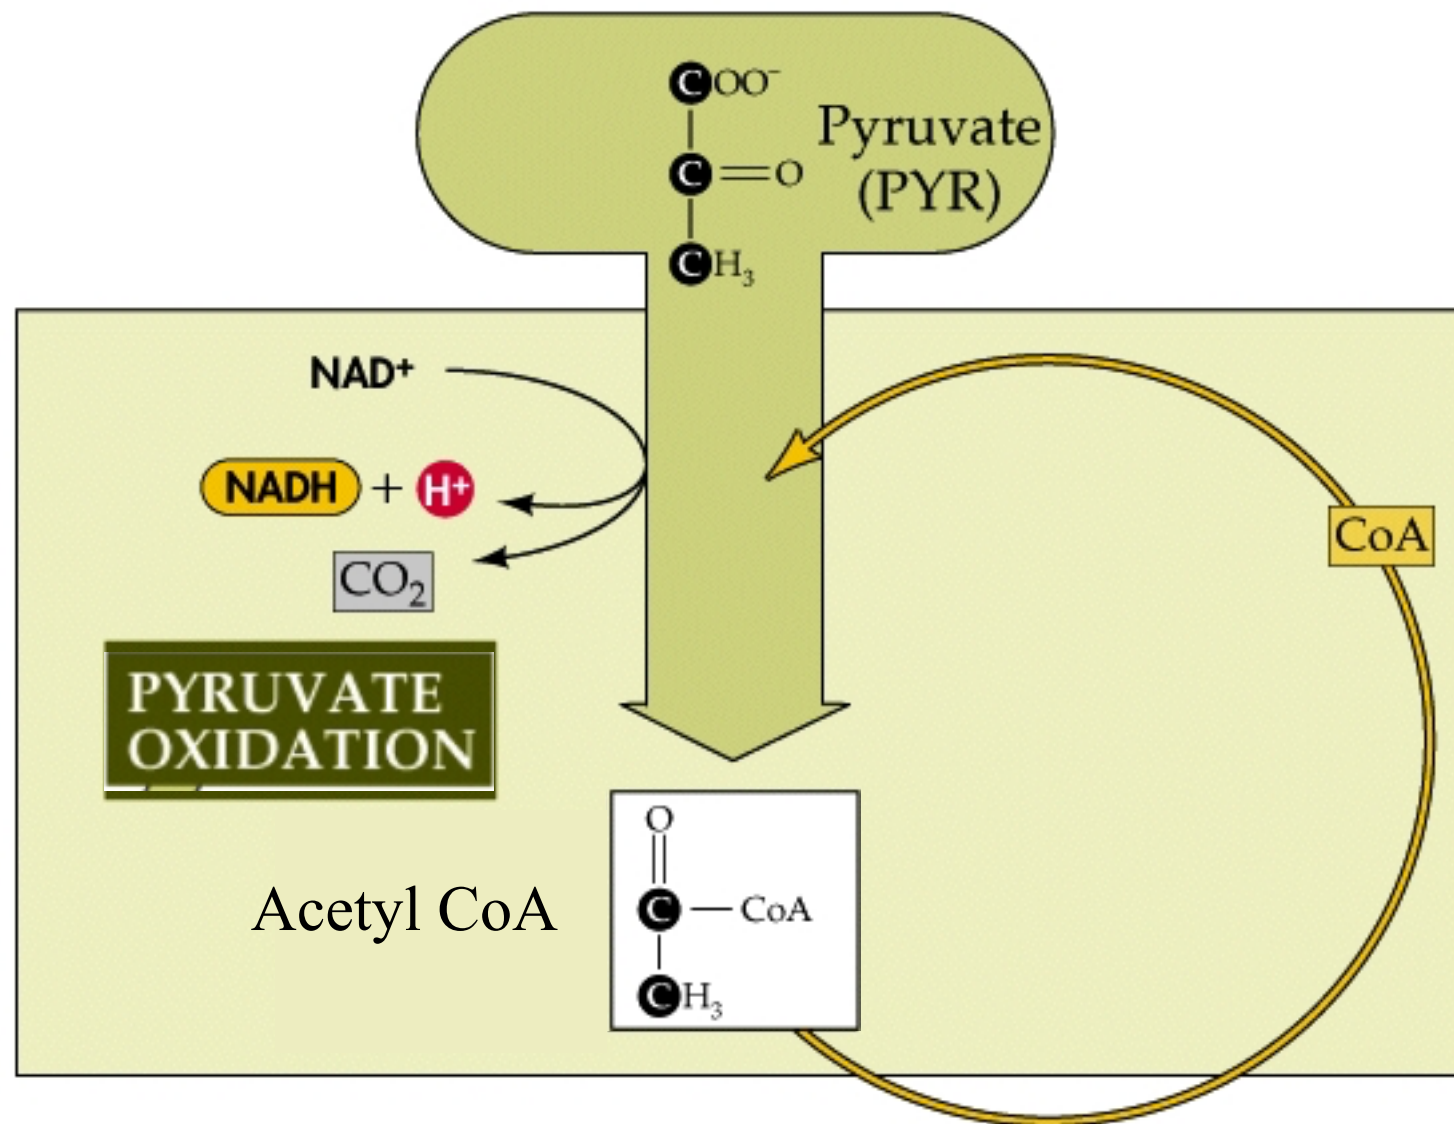

2 x Acetyl CoA

6 carbons

2 x 3 carbons

2 x 2 carbons

6.1 *A Few Examples of Nonprotein Molecular "Partners" of Enzymes*

TYPE OF MOLECULE	ROLE IN CATALYZED REACTIONS
<i>Cofactors</i>	
Iron	Oxidation/reduction
Copper	Oxidation/reduction
Zinc	Helps bind NAD
<i>Coenzymes</i>	
Biotin	Carries —COO^-
Coenzyme A	Carries $\text{—CH}_2\text{—CH}_3$
NAD	Carries electrons
FAD	Carries electrons
<i>Prosthetic groups</i>	
Heme	Binds ions, O_2 , and electrons; contains iron cofactor
Flavin	Binds electrons
Retinal	Converts light energy

The $\Delta G^{\circ'}$ of this oxidation reaction is **-52.4 kcal/mol**.
 (For comparisons sake, remember that the $\Delta G^{\circ'}$ of the ATP to ADP reaction is **~7.3 kcal/mol**)

Think of **NADH + H⁺**, therefore, as a pre-packaged form of available "potential" energy source, that can eventually be turned into **ATP** (approximately **3 ATP's**)

Total Net yield = 4 ATP, 2 FADH₂ and 10 NADH + H⁺

The ΔG° of this oxidation reaction is **-52.4 kcal/mol**.
(For comparisons sake, remember that the ΔG° of the ATP to ADP reaction is **~7.3 kcal/mol**)

Think of **NADH + H⁺**, therefore, as a pre-packaged form of available "potential" energy source, that can eventually be turned into **ATP** (approximately **3 ATP's**)

Total Net yield = 4 ATP, 2 FADH₂ and 10 NADH + H⁺
